

IN THE CORAL TRIANGLE

Long before humans appeared in the Coral Triangle, marine turtles were already swimming the region's seas and laying eggs on its beaches. These iconic species are not only crucial links in the Coral Triangle's ecosystems, they also attract visitors from all around the world.

open seas as well as coastal areas, and some loggerheads may too.

Coastal shallow Developmental water foraging migration (immature and (5-20 years) adult turtles) Breeding migration (2 - 8 years) adults return to foraging areas Lost Years

Number of marine turtle species in the world

Number of marine turtle species that either forage, breed or nest in the Coral Triangle

OVER 3000

over the course of trans-Pacific migration from Jamursba Medi Beach (or Bird's head peninsula, Papua in Indonesia) to the northwest coast of USA Benson et al, 2007

Percentage of hatchlings that do not survive for more than a year.

Eggs incubated above about 30° C tend to develop into females, and those incubated below about 28° C develop into males. Global warming could skew sex ratios, resulting in more females. Hawkes et al. 2007

Warming regional ocean temperatures could lead to long-term decreased food supply and reduced loggerhead turtle nesting.

Chaloupka et al, 2008

The Coral Triangle - the nursery of the seas - is the most diverse marine region on the planet, covering some 6 million km² of ocean across 6 countries in the Asia-Pacific region. This ecological wonder is home to 76% of the world's reef-building coral species and 6 out the 7 known species of marine turtles.
